

# M57 Diesel Delete Checklist:

**NOTE: This process is for OFF-ROAD USE ONLY!! If you do not have any experience in installing any of these parts, please take it to a professional.**

- Does the car/truck have a count down light? (**DDE has to be shipped to us if countdown is on**)
- Is the check engine light on? (**fault codes have to be listed when requesting a tune**)
- Customer has to state if the **DEF tanks are installed or removed when requesting a tune.**
- If tanks are removed, you have to disconnect all sensors and electrical connections leading to the tanks.
- Downpipe should only have the Front O2 sensor & EGT sensor closest to the large turbo plugged in. All other exhaust sensors need to be disconnected from the wiring harness and removed from the system.
- SCR filter needs to be modified or removed from the exhaust system
- If the EGR valve is installed, but the EGR cooler has been removed, the power connection to the valve needs to be unplugged.
- 2009 - 2011 335d & 2009 - 2012 X5 35d share the same DDE. The 2013 late model E70 has a different DDE & software revision.
- The EGS (transmission computer) will need time to adapt after the tune has been uploaded.
